Greenhouse Gas Emissions (GHG) Accounting

Whether you're a grower, retailer, or holding company we help your company meet compliance and risk management challenges by developing accounting, reporting and technology frameworks that support your current needs and position you for sustainable growth.

The Benefits of Measuring and Reducing Your GHG Emissions

Beyond compliance, measuring your emissions helps identify opportunities for process optimization, innovation, and potential cost savings. Reporting on your company's emissions provides greater transparency for your stakeholders and supports global efforts to combat climate change. The key to gaining a competitive advantage in the evolving regulatory and voluntary disclosure environment is to understand the climate risk profile of your business more fully. Our team is ready to help you gain that understanding and begin to take measurable actions to reduce your carbon footprint.

Our Process

We'll conduct a scoping call to better understand your motivations and determine which GHG accounting tool would be the right fit for you. During the call, we'll:

- ◆ Review the current state of your company's GHG data collection and measurement process.
- ◆ Assess the organization's understanding of any industry-specific significant contributors to your carbon footprint.
- ◆ Discuss your existing climate and sustainability concerns and/or goals.
- ◆ Examine stakeholder demands for or expectations around GHG reporting and which frameworks are appropriate to consider.
- ◆ Explore the relevance for obtaining a third-party certification that can be leveraged to demonstrate your company's commitment to climate action.

Our guided measurement process is designed to help you increase communication across your organization and generate pathways for building interdepartmental support and a tangible action plan for measuring and reducing your emissions.
